

Form Brainstorming - May 27

North Star:

- * Improve Completion Rate
- * Maintain/Improve Answer Accuracy

What do we like?

Biggest Themes:

- * Straight-forward, simple, clear, consistent
- * We own the form and therefore can have granular tracking, data understanding
- * Breadcrumbs sense of progress and chunked
- * Interstitials fuel information
- * Has a help section
- * Professional, trustworthy

Discussion:

- * Interstitial has value but disconnected, more tailored contextual to responses or interests. One way to get more value out of the form. Can this take a different form?
 - * Can this be a human persona? Refine with post-match user profiles
- * Breadcrumbs may need to be sacrificed in a dynamic form experience. Could do more with sectioning, 3m vs 90 days perspective
 - * Tax experience (TurboTax) - can we work with them?
 - * Does plaid offer tax or income docs? - income endpoint has payroll
 - * Carrot and stick
 - * Skipping - if we are working towards aspirational context, does it make sense to skip all the high net worth questions?
 - * Dont announce we're skipping or dont skip (A/B Test!)
 - * Or how can we help you get there
- * Keep the form not feeling overwhelming
- * Give users feedback while completing the form
- * Interstitial re-engagement email opportunity, tidbits that give positive feedback on their answers. Room for positive feedback.

What do we not like?

Biggest Themes:

- * Big Constraints
 - * Design UX to be embed into website
 - * Hardcoded assumptions
 - * Auction very tied to the form
- * Too long
- * Look and Feel (UX)
 - * No motivation/not fun/engaging
 - * dense
 - * hard to scan
 - * not contextualizing
- * One size fit all - not adapting to different users
- * Confusion through jargon
 - * Tedious controls
 - * not able to skip/back button
 - * minimal help outside why we ask
- * Not re-engaging users

Discussions:

- * Problem solving / opportunity seeking - our form is not aspirational or deducting
- * embed - launchthat, we use it for the match gen API transfer control (Short term)
 - * is LaunchThat married to the embed experience?
 - * Burke clickout
- * Auction is very tied to form order of operations would be a project
- * SEC suitability - if we ask its "fact"
- * Does identity graph information get treated the same as reported information
- * Is the length the problem or a piece of the experience?
 - * If we can make it engaging the length doesnt matter
 - * Tiktok experience would be tough for our form

Assumptions / Hypothesis?

Biggest Themes:

- * Assume more questions mean better quality or are meaningful. length = better or higher quality
- * We assume leads have a general comfort level with the questions - understand the questions or understand how to respond or have information to respond.
- * We assume that leads understand the questions and understand that they will get a match and are ready for a match.
 - * Our form is good for high intent
- * We assume some leads may be answering dishonestly to lead to a better match

- * We assume we need to have all the questions answered before the match
- * We assume why we ask is sufficient for help
- * We assume the person filling out the form is filling it out for themselves vs an assistants
- * We assume that starting in contact info may be a bad experience
- * We assume one size fits all
 - * We assume the options we offer are all the ones the lead needs
- * We assume we have a strong enough verification method
- * We assume advisors care about all the biddable questions
 - * RIA feedback is: life stages, can drop questions, optional notes
- * We assume that we need granularity during the form to run the auction
 - * what can we defer to post-match

Discussions:

- * Followup: Are there ways to make these no longer assumptions? Research, tests datapoints, stack ranking, tests that can help answer some of these assumptions
- * Does the question order need to be deterministic? can there be an aspect of randomization
- * Do we need to run the auction right away?
- * We assume high drop questions are either high friction or lead doesnt have commitment to continue
- * Boldin - short questionnaire (10 q) more intentful vs long questionnaire. lead can choose, explains what the difference is. DA doesnt have "better" option that comes with a long form, what does a lesser thing look like?
 - * Specialty focus vs a full service advisor?
- * Can we add a flow that asks if you are researching vs committed? Can provide a different questionnaire? Pre- questionnaire?
- * One option - Short form is 3 questions then connect accounts
- * Onboarding experience vs lead gen experience
- * Halo is a good option for why we ask and interstitial context/information
- * Dynamic options to get to lead specific needs
- * We assume that we do not need: Other (please specify)
- * freeform provide interesting responses

How do we get there?

- * Pre-form questionnaire branching for shoppers (are you ready, do you want something else?) to help identify intent, need or readiness
 - * Could they start at Halo? Look at ways to use pieces of Halo in a limited form
 - * Pref relationship, specialties, how do you manage your \$ → response could be triage opportunity
 - * Have you worked with a financial advisor? if yes, then assume they understand
- * Branching to tailor the form experience
 - * remove irrelevant answers based on responses or information we know
 - * what are the ingress points? (they are the same questions)

- * pre-high drop questions could be good places for branch testing
- * move high drop questions to the end to get more data up front
- * Select assets buckets that you have...(zoe, monarch)
- * Ask contact information in the front
- * Generate our own form using the match gen api to support testing
- * Personalization
 - * Help-seeking: how can they send a signal? why we ask and interstitials. based on responses. we could start with age.
 - * A button to say "this was not helpful"
 - * bigger step: Pull from identity graph and ask agent to generate a fun fact
 - * add name to interstitial
 - * start by asking "what do you want us to call you?"
 - * person with the name on the first page "hi my name is..." with a picture, put in bottom right.....
 - * Layered help: tool tip, why we ask, halo
- * User Persona
 - * Balance fun and professional
 - * Treat yourself - parks a recs
- * Make the form easier
 - * zip code people are used to and generate city, state
 - * typeahead
- * Express form
 - * still ask preference questions
 - * Ask email, name, phone and say we will pull the rest
 - * validation questions
- * Do you have an advisor?
 - * Who is your advisor? (dont match w/ that person)
 - * Why do you want a new advisor?
- * AUM -
 - * we are assuming that advisors care about the buckets
 - * can we simplify into 1 bucket or assets, liabilities?
 - * can we remove the real estate slider?

Next Steps:

- * Create issues for low lift tests
- * How do these turn into longer-term idealized form flow
- * What do we need to do to separate the UI from the form logic, and how can we use the match gen API to support?
 - * What are the gaps?
 - * We can use Match Gen API for DA website
- * Write findings from 3P data evaluations

* Data that corresponds to high drop questions
